

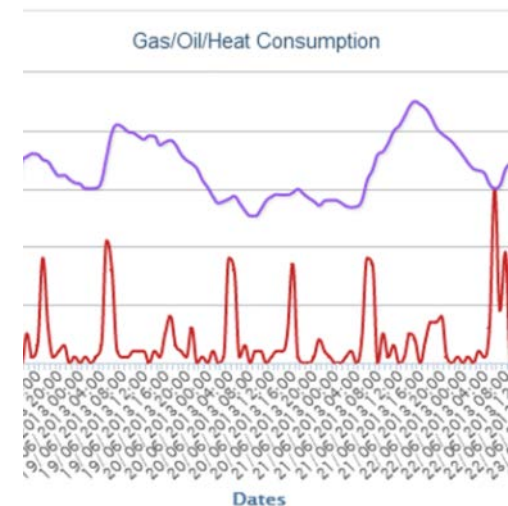

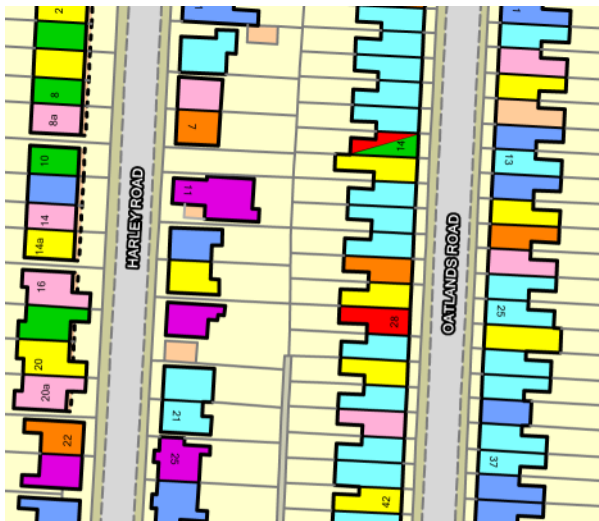

# Mapping low carbon communities

Understanding the energy and carbon performance in your community and household

## EVALOC carbon mapping, Kirklees Council

16 July 2014

Professor Rajat Gupta, Laura Barnfield and **Matt Gregg**  
OISD Low Carbon Building Group, Oxford Brookes University, UK  
[rgupta@brookes.ac.uk](mailto:rgupta@brookes.ac.uk)

# What is the context?

***“It will be impossible to meet the 2050 objective without changing emissions from homes”***

(UK Housing Energy Fact File, DECC 2012)

- Climate Change Act 2008: UK committed to an **80% reduction** in carbon emissions by 2050 (from 1990 levels)
- Household energy use accounts for **26%** of the total UK final consumption
- In 2050, **majority** of **existing homes** will still be occupied

## Total UK energy consumption 2011

(UK housing energy fact file, 2012)

# How do we change carbon emissions from homes?

- **Building fabric:** walls, floor, roof and windows
- New heating and electricity **generating technologies**
- Changing **energy behaviours** and practices

# What is EVALOC?

- Three year research project to **Evaluate six selected low carbon communities** funded under the DECC's **Low Carbon Communities Challenge** (LCCC)
- In terms of their:
  - **IMPACTS** (on changing individual and community energy behaviours)
  - **EFFECTIVENESS** (on achieving real-savings in energy use CO<sub>2</sub> emissions)
  - **DECoRuM carbon mapping**
  - **SUCCESS** (in bringing about sustained and systemic change).

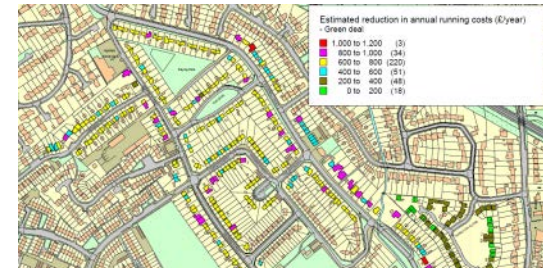

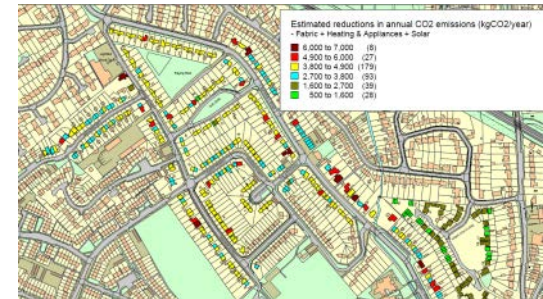

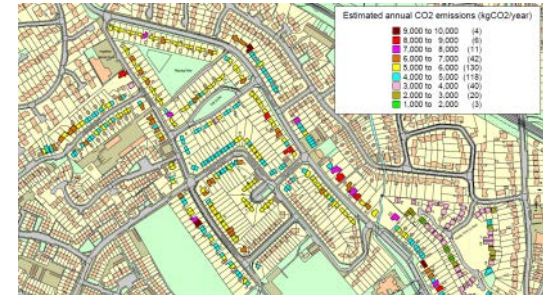

# What is carbon mapping?

- **Baseline carbon map on a house-by-house level**

EVALOC: Pre-2010 --> 2012

- **Evaluating potential energy and CO<sub>2</sub> reductions:** best practice energy efficiency measures, low carbon systems and renewable energy technologies
- **Assess cost-effectiveness:** Identify the most cost-effective measures for reducing CO<sub>2</sub> emissions
- **Visualisation and communication:** Visualise and communicate the anticipated energy and CO<sub>2</sub> savings through DECoRuM to residents.

# Where does DECoRuM get its input data?

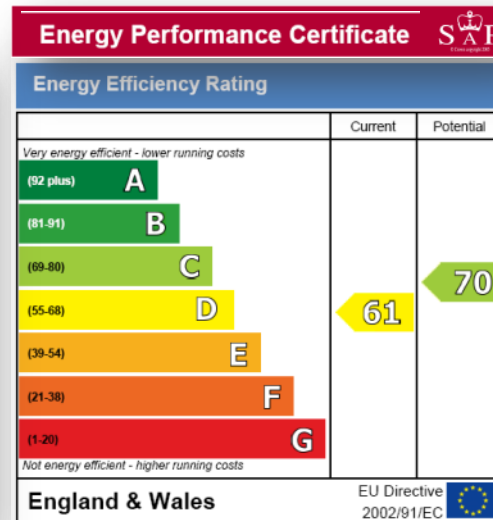

DECoRuM gathers data from a wide array of sources to develop a robust estimation of energy use and resultant CO<sub>2</sub> emissions at a local scale.

## Energy questionnaires

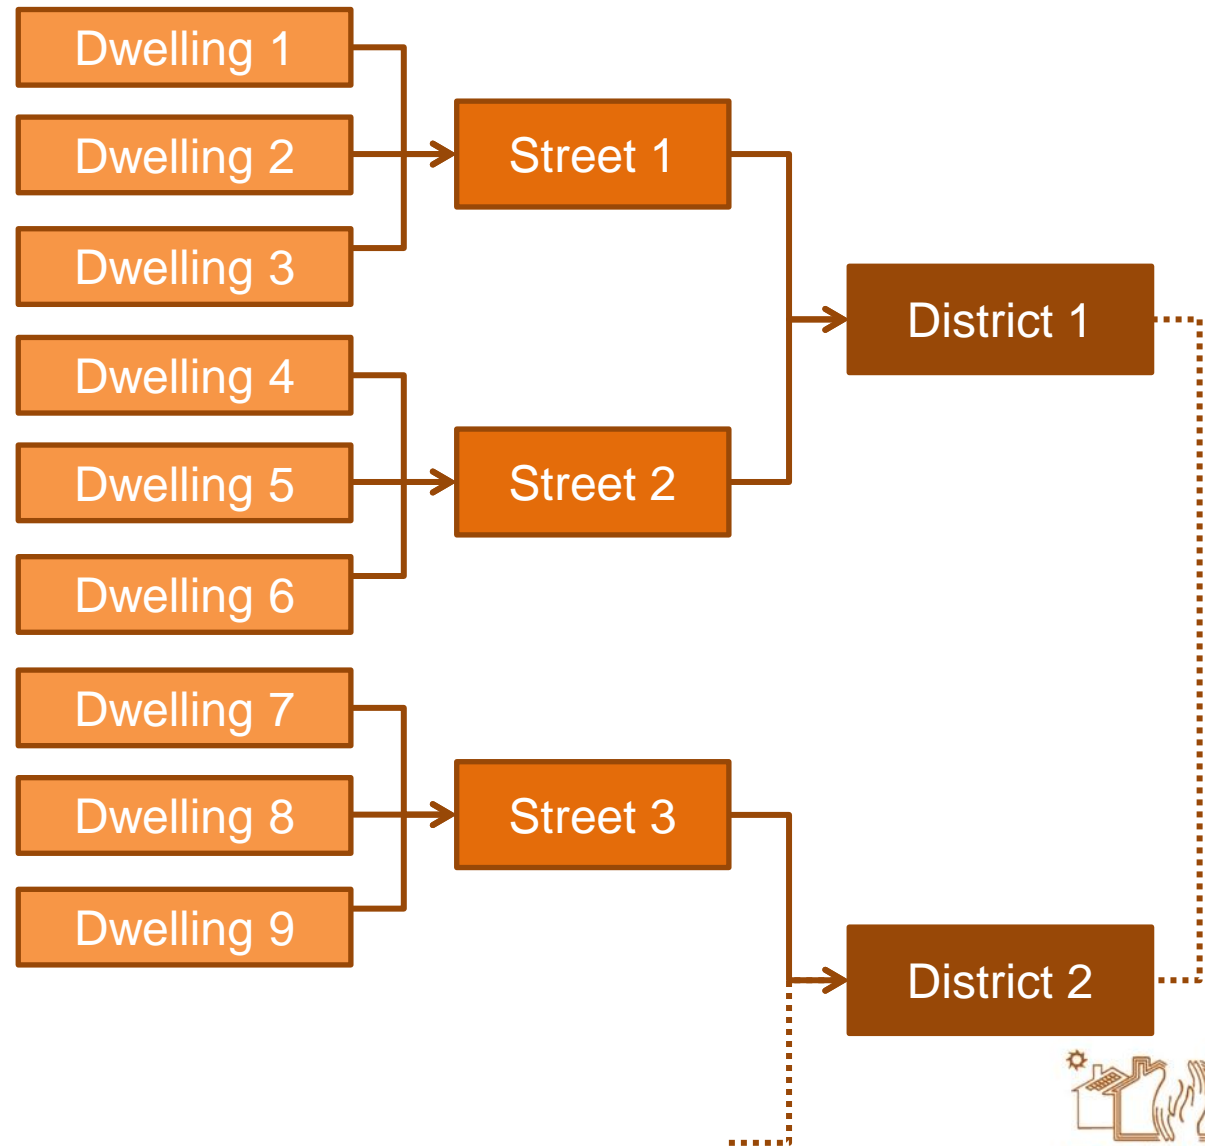

Google Maps and street view

# How is it done?

DECoRuM  
baseline energy  
model **estimates**  
**energy**  
**consumption**  
and **CO<sub>2</sub>**  
**emissions of**  
**individual**  
**dwelling**s as the  
basic component  
for calculation,  
and then  
aggregates  
these to an  
**urban scale**.

# Carbon mapping Hillhouse

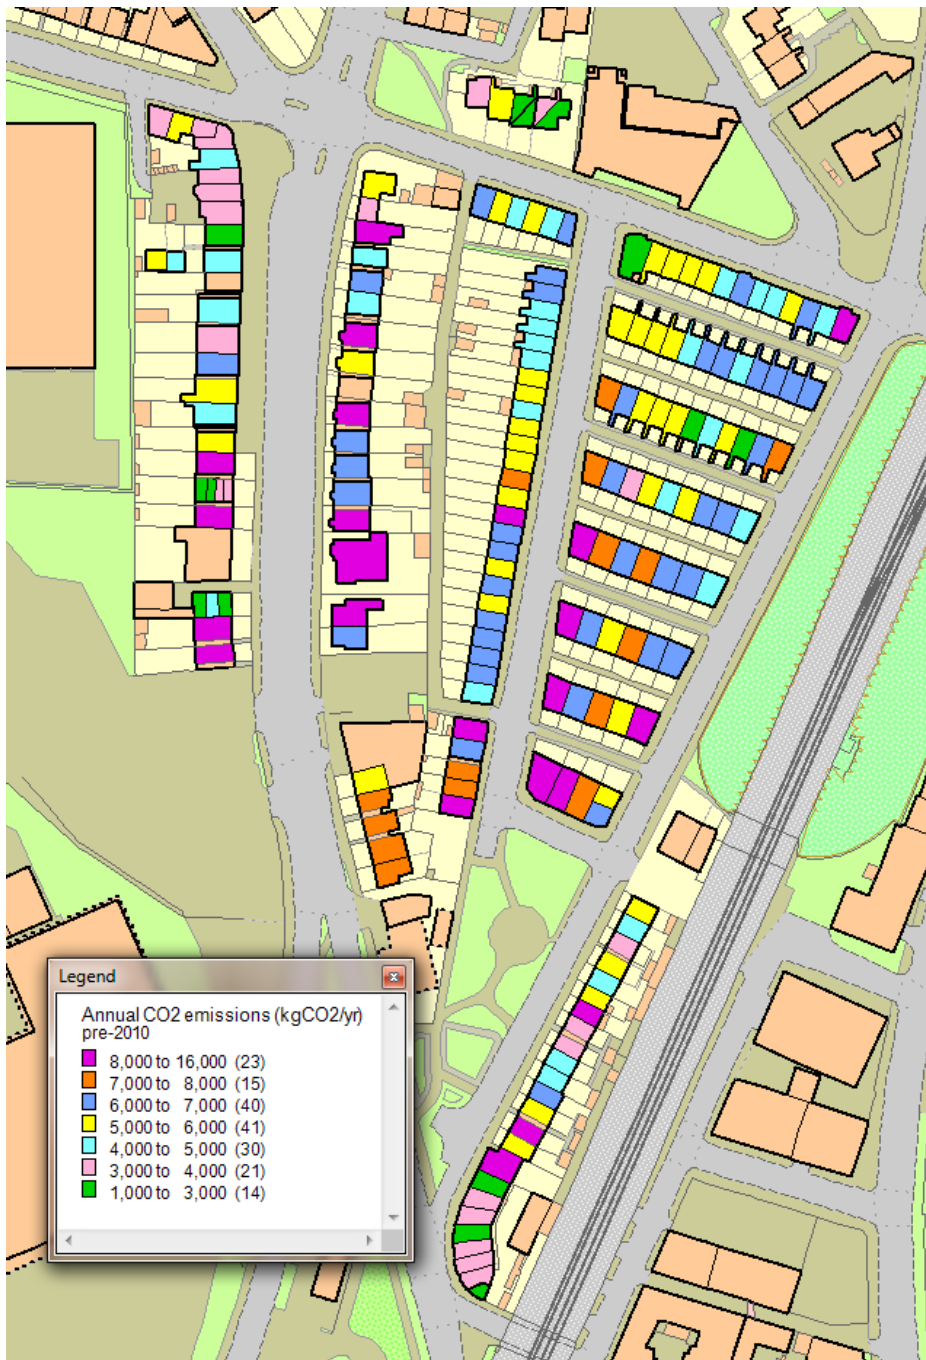

- **Hillhouse mapped area:**  
184 dwellings
- Dominant build form:  
**Pre-1900 terraced housing**

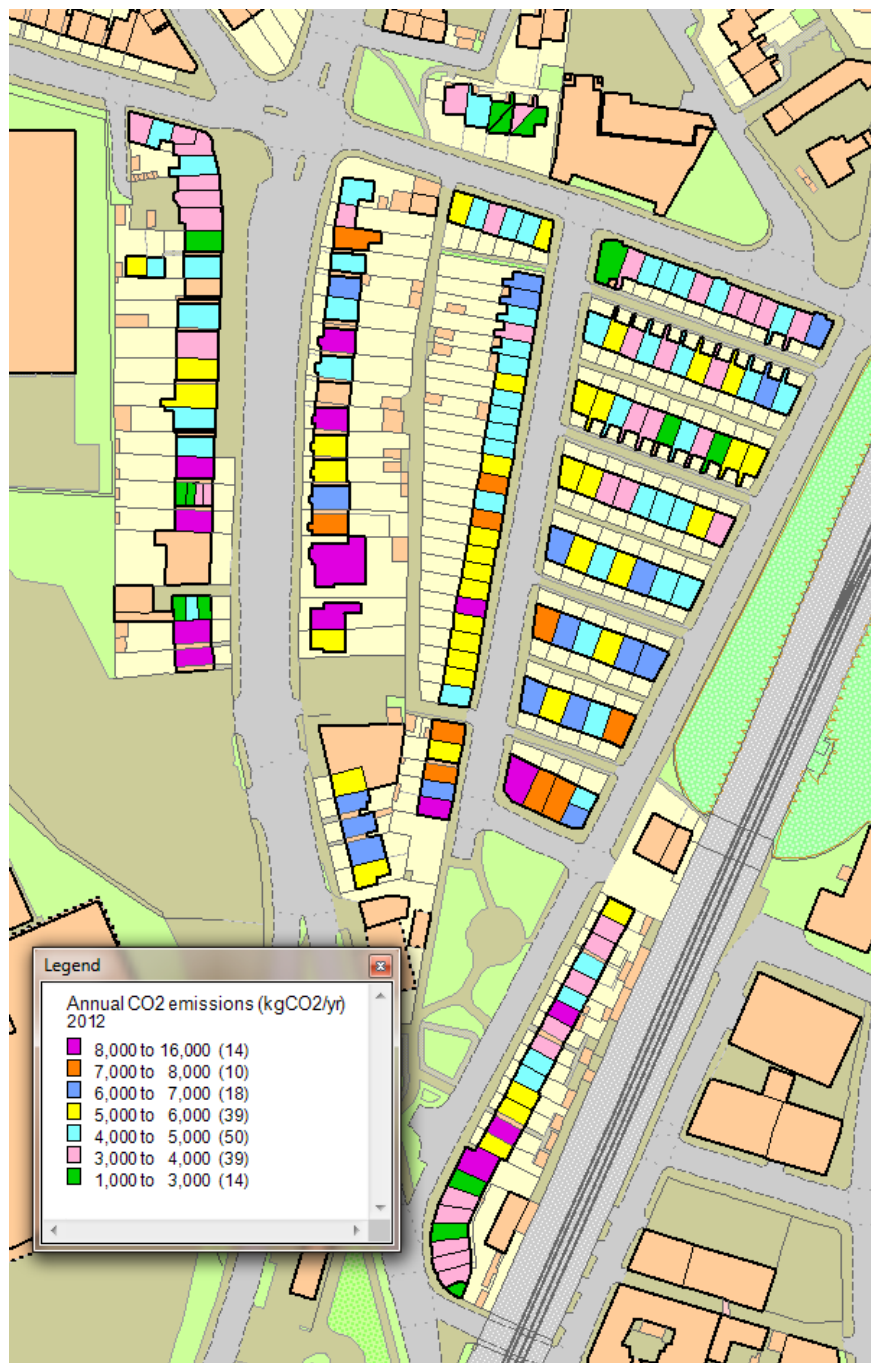

# Findings: Pre 2010

Average annual CO<sub>2</sub> emissions for  
*mapped area*: **5,624 kgCO<sub>2</sub>/yr**

Average annual energy costs for  
*mapped area*: **£1,341**

# Findings: 2012

Average annual CO<sub>2</sub> emissions for  
*mapped area*: **4,870 kgCO<sub>2</sub>/yr**

**13% reduction**

**How?**

Photovoltaic systems  
Loft insulation  
Double glazing  
Knowledge

Average annual energy costs for  
*mapped area*: **£1,170**

# What can be done in your home to save energy?

# Fabric improvement

**184 homes** could install external wall insulation for an average **16% reduction** in CO<sub>2</sub> emissions

**82 homes** could install or top-up loft insulation for an average **2% reduction** in CO<sub>2</sub> emissions

**184 homes** could install internal wall insulation for an average **16% reduction** in CO<sub>2</sub> emissions

# Fabric improvement

**148 homes** could install  
**ground floor insulation** for  
an average **11%  
reduction** in CO<sub>2</sub>  
emissions

**182 homes** could  
**draught proof** windows,  
doors, loft hatch and  
chimneys for an average  
**2.5% reduction** in  
CO<sub>2</sub> emissions

**37 homes** could  
install **double glazing**  
for an average **7%  
reduction** in CO<sub>2</sub>  
emissions

# Upgrade heating system

**153 homes** could install a **condensing boiler** or replace existing boiler, insulate hot water cylinder and insulate pipework for an average **16% reduction** in CO<sub>2</sub> emissions

# Energy efficient lighting and turn down thermostat

## Individual measures: Energy efficient lighting Turn down thermostat

**132 homes** could install  
**100% energy efficient lighting**  
(LED) for an average **2%**  
**reduction** in CO<sub>2</sub> emissions

Turning down your  
thermostat from **21°** to  
**19°** could provide a **10%**  
**reduction** in CO<sub>2</sub> emissions

# Solar energy systems

## Individual measures: Solar energy systems

**98 homes** could install **photovoltaic panels** for an average **8% reduction** in CO<sub>2</sub> emissions

**167 homes** could install **solar hot water system** for an average **9% reduction** in CO<sub>2</sub> emissions

# Adopting a package approach

## Fabric improvement Package

- Wall insulation (cavity or solid)
- Loft insulation
- Floor insulation
- Double glazing
- Draught proofing

## Fabric and heating upgrade Package

### Fabric improvement package +

- New condensing boiler
- Hot water tank insulation
- Pipework insulation
- Heating controls

## Deep renovation

### Fabric and heating upgrade package +

- Photovoltaic solar system
- Solar hot water system

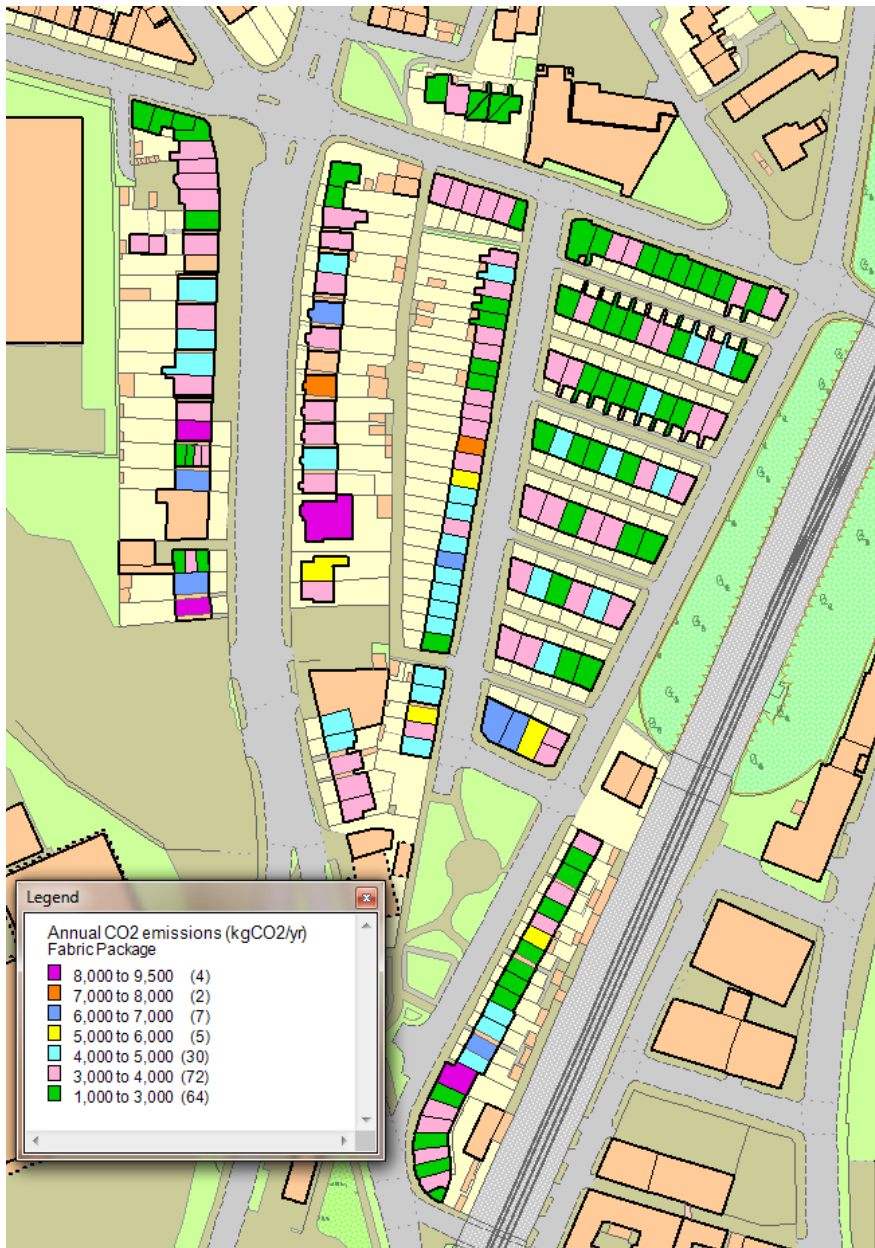

# Fabric improvement package

Total reduction in CO<sub>2</sub> emissions after package:

**Reduction from 2012 (baseline)**

- **29% for Solid wall homes**

Average energy cost reduction: **-£388.25**

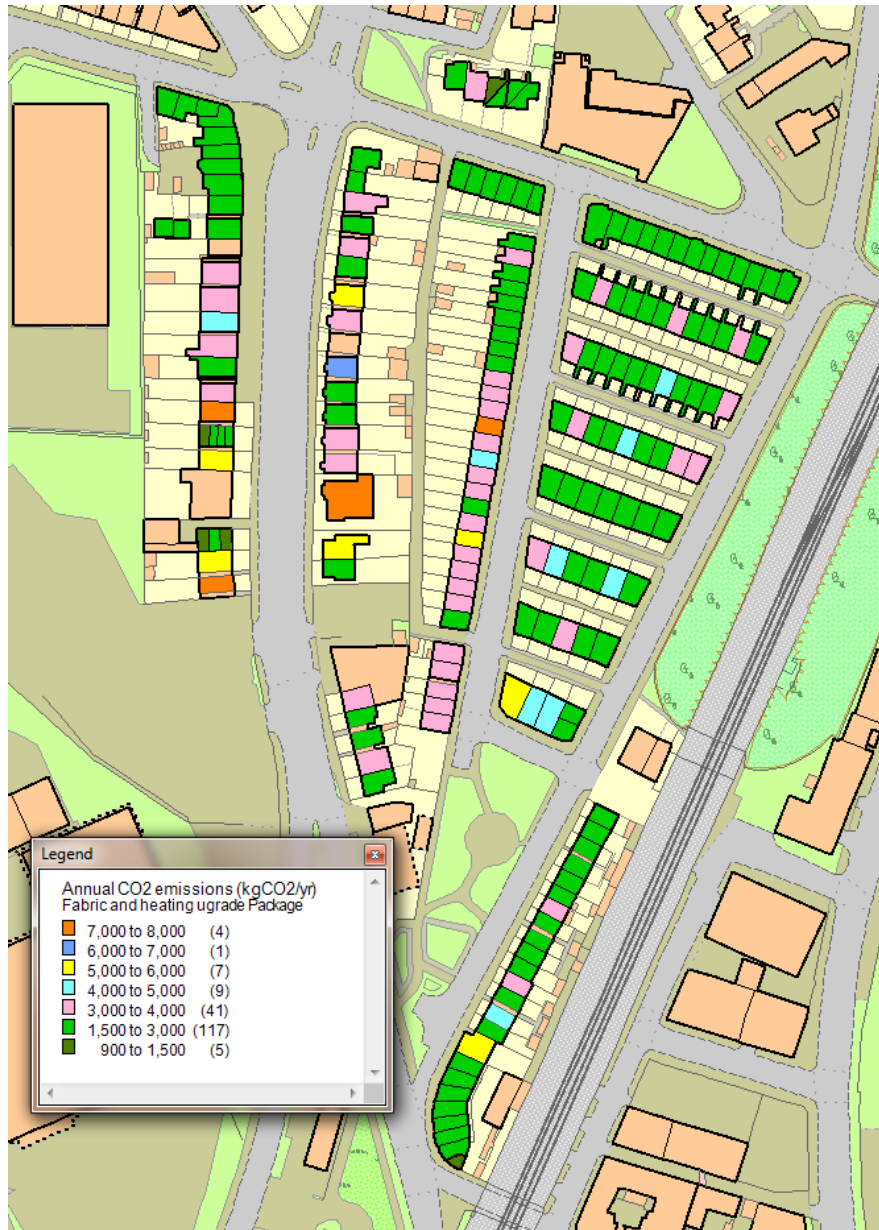

# Fabric and heating upgrade package

Total reduction in CO<sub>2</sub> emissions after package:

**Reduction from 2012 (baseline)**

- **44% for Solid wall homes**

Average energy cost reduction: **-£591.09**

## Deep renovation

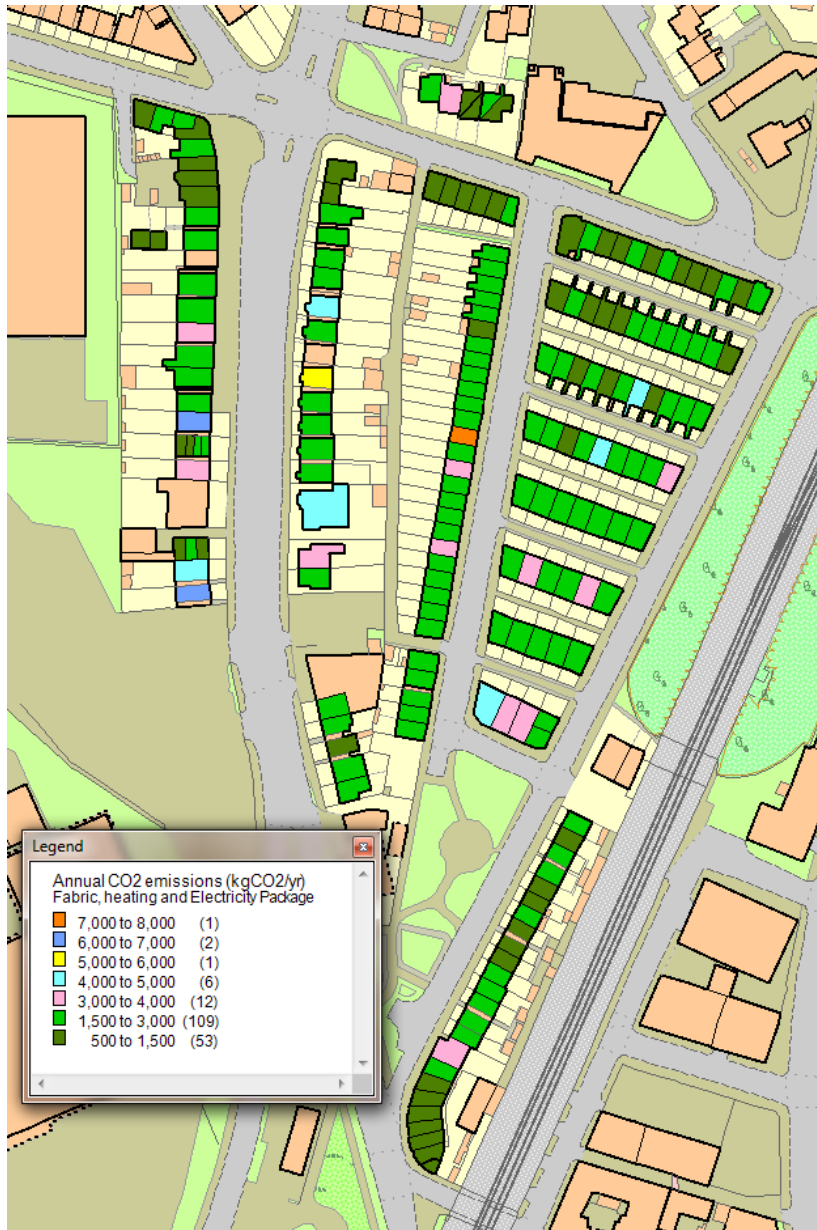

Total reduction in CO<sub>2</sub> emissions after package:

## Reduction from 2012 (baseline)

- **59%** for Solid wall homes

Average energy cost reduction: **-£941.01\***

*\*Running cost reductions include FIT and RHI payments for solar systems*

# Thermal imaging

# What can thermal imaging show us?

Visualise changes in **temperature** across an object revealing **potential heat losses** from **building fabric**.

This helps:

- **Identify** potential areas for energy efficient improvements
- **Evaluate or verify** the completion of fabric improvements
- **Makes energy visible**

# Thermal imaging survey

Heat loss in un-insulated solid walls

## Personal feedback available:

*Please speak to an EVALOC researcher following this event to discuss the thermal imaging survey of your home*

Improvements offered by solid (and cavity) wall insulation

Contrast in loft insulation & cavity wall insulation

## Carbon mapping

- Makes energy use visible for homeowner in a useful way -influencing energy literacy
- Assists in prioritising action and change to home or community
- Helps communities understand local housing stock and local impact
- Potential to increase take-up of reduction measures
- Comparison of current and future performance potential

## Thermal imaging

- Helps substantiate findings with carbon maps
- Assists in visual identification of specific areas for improvement

# Thank you!
